
Weather App

Overview

Develop a Weather App.

- ReactJS must be used.
- Any library other than ReactJS cannot be used.
- Any CSS library (excluding SASS and TailwindCSS) cannot be used.
- TailwindCSS must be used.
- There should be a search bar where we can search for country or city names.
- Initially, the application should prompt the user for location information and display the weather based on the user's location.
- All data obtained from the API should be utilized as efficiently as possible.
- Any UI can be used.
- The project should include comments explaining functions, states, and hooks (in other words, the written code should be documented).
- The project should be optimized and able to run without overloading the browser.
- The project should be responsive.

Technologies

ReactJS, TailwindCSS, Javascript, HTML, CSS, Git

API

- [OpenWeatherMap](#)

Note

- Attention to detail is very important
- Your final work should be pushed to a repository on Punica Gitlab and the link to the project should be sent via email to fiat.ulukaya@neu.edu.tr.
- No, any libraries.
